Networks

Multiplication of networks

Derived networks

References

A *network* $\mathcal{N} = (\mathcal{V}, \mathcal{L}, \mathcal{P}, \mathcal{W})$ consists of:

• a graph $\mathcal{G}=(\mathcal{V},\mathcal{L})$, where \mathcal{V} is the set of nodes, \mathcal{A} is the set of arcs, \mathcal{E} is the set of edges, and $\mathcal{L}=\mathcal{E}\cup\mathcal{A}$ is the set of links.

$$n = |\mathcal{V}|, m = |\mathcal{L}|$$

- \mathcal{P} node value functions / properties: $p: \mathcal{V} \to A$
- W link value functions / weights: $w: \mathcal{L} \to B$

Two-mode networks

Derived Networks

V. Batagelj

Networks

Multiplication of networks

Derived networks

Reference

In a *two-mode* network $\mathcal{N}=((\mathcal{U},\mathcal{V}),\mathcal{L},\mathcal{P},\mathcal{W})$ the set of nodes consists of two disjoint sets of nodes \mathcal{U} and \mathcal{V} , and all the links from \mathcal{L} have one endnode in \mathcal{U} and the other node in \mathcal{V} . Often also a *weight* $w:\mathcal{L}\to\mathbb{R}\in\mathcal{W}$ is given; if not, we assume w(u,v)=1 for all $(u,v)\in\mathcal{L}-a$ *binary* network. A two-mode network can also be described by a rectangular matrix $\mathbf{A}=[a_{uv}]_{\mathcal{U}\times\mathcal{V}}$.

$$a_{uv} = egin{cases} w(u,v) & (u,v) \in \mathcal{L} \\ 0 & ext{otherwise} \end{cases}$$

Multirelational and linked networks

Derived Networks

V. Batagelj

Networks

Multiplication of networks

Derived networks

Reference

In a *linked* or *multimodal* network

$$\mathcal{N} = ((\mathcal{V}_1, \mathcal{V}_2, \dots, \mathcal{V}_j), (\mathcal{L}_1, \mathcal{L}_2, \dots, \mathcal{L}_k), \mathcal{P}, \mathcal{W})$$

the set of nodes $\mathcal V$ is partitioned into subsets (modes) $\mathcal V_i$, and the set of links $\mathcal L$ is partitioned into subsets (relations) $\mathcal L_i$, $\mathcal L_s \subseteq \mathcal V_p \times \mathcal V_q$. Properties and weights are usually partial functions.

A linked network can be described also as a *collection* of one/two-mode networks $(\mathcal{N}_k)_{k \in K}$.

Multiplication of networks

Derived Networks

V. Batagelj

Network

Multiplication of networks

networks

Reference

Let **UV** (on sets U and V) and **VZ** (on sets V and Z) be matrices of the corresponding two-mode networks $\mathcal{N}_{UV} = ((U, V), L_{UV}, w_{UV})$ and $\mathcal{N}_{VZ} = ((V, Z), L_{VZ}, w_{VZ})$; L – set of links, w – weight on links. Their product $\mathbf{UZ} = \mathbf{UV} \cdot \mathbf{VZ}$

$$UZ[u,z] = \sum_{v \in V} UV[u,v] \cdot VZ[v,z]$$

determines the corresponding product network $\mathcal{N}_{UZ} = ((U, Z), L_{UZ}, w_{UZ}) = \mathcal{N}_{UV} \cdot \mathcal{N}_{VZ}.$

The definition can be extended to semirings [Cerinšek and Batagelj(2017)].

What is the complexity of computing the product of large sparse networks [Batagelj and Cerinšek(2013), Batagelj et al.(2014)]?

Multiplication of networks meaning

Derived Networks

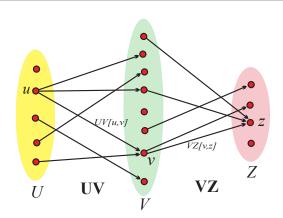

V. Batagelj

Network:

Multiplication of networks

Derived networks

Reference

If networks \mathcal{N}_{UV} and \mathcal{N}_{VZ} are binary the value of $UZ[u,z] = |N_{UV}(u) \cap N_{ZV}(z)|$ (N – set of neigbors) counts the number of ways we can go from $u \in U$ to $z \in Z$ passing through V.

Outer product decomposition

Derived Networks

V. Batagelj

Network

Multiplication of networks

networks

Reference

For vectors $x = [x_1, x_2, ..., x_n]$ and $y = [y_1, y_2, ..., y_m]$ their *outer* product $x \circ y$ is defined as a matrix $x \circ y = [x_i \cdot y_j]_{n \times m}$. The product **UZ** can be expressed as the *outer product decomposition* [Batagelj(2020)]

$$\mathbf{UZ} = \mathbf{UV} \cdot \mathbf{VZ} = \sum_{v} \mathbf{H}_{v} \quad \text{where} \quad \mathbf{H}_{v} = \mathbf{UV}[\cdot, v] \circ \mathbf{VZ}[v, \cdot]$$

For binary matrices we have $\mathbf{H}_{v} = K_{N_{UV}(v),N_{VZ}(v)}$ – the product is a sum of complete bipartite subgraphs.

Let $T(\mathbf{UV}) = \sum_{u} \sum_{v} UV[u, v]$ denote the *total weight* of the network \mathcal{N}_{UV} . Then

$$T(\mathbf{UZ}) = \sum_{v} T(\mathbf{H}_v)$$
 where $T(\mathbf{H}_v) = \operatorname{wid}_{UV}(v) \cdot \operatorname{wod}_{VZ}(v)$,

$$\operatorname{wid}_{\mathit{UV}}(v) = \sum_{\mathit{u}} \mathit{UV}[\mathit{u}, \mathit{v}] \quad \text{and} \quad \operatorname{wod}_{\mathit{VZ}}(v) = \sum_{\mathit{z}} \mathit{VZ}[\mathit{v}, \mathit{z}].$$

Fast multiplication of sparse networks

Derived Networks

V. Batagelj

Network

Multiplication of networks

networks

Defense

Most of large networks are sparse (Dunbar's number). We can multiply sparse networks faster considering only nonzero elements [Batagelj et al.(2014)]

$$\begin{split} & \text{for } v \text{ in } V \text{ do} \\ & \text{for } (u,z) \in N_{VU}(v) \times N_{VZ}(v) \text{ do} \\ & \text{if } \exists UZ[u,z] \text{ then } UZ[u,z] := UZ[u,z] + UV[u,v] \cdot VZ[v,z] \\ & \text{else } \text{new } UZ[u,z] := UV[u,v] \cdot VZ[v,z] \end{split}$$

M(code) = the number of multiplications in the execution of *code*.

$$M(\mathbf{H}_{v}) = \mathrm{id}_{UV}(v) \cdot \mathrm{od}_{VZ}(v), \quad A = \max_{v} \mathrm{id}_{UV}(v) \cdot \mathrm{od}_{VZ}(v)$$

$$A \leq M(\mathbf{UZ}) \leq |V|A$$

For $v \in V$ such that $id_{UV}(v)$, $od_{VZ}(v) \sim O(n)$ we have $A \sim O(n^2)$. $M(\mathbf{UZ})$ has at least quadratic complexity.

Criteria for fast multiplication

Derived Networks

V. Batagelj

Network

Multiplication of networks

Derived networks

D 6

For a sequence (in decreasing order) $\mathbf{d} = (d_i)_{i \in I}$

$$WP(\mathbf{d}) = \arg\min_{i} \{i \in I : d_i < i\}$$

is called its *Welsh-Powel number* [Welsh and Powell(1967)].

 $wp_U = WP(id_{UV})$ and $wp_Z = WP(od_{VZ})$;

$$WP_U = \{v \in V : \operatorname{id}(v) \ge wp_U\} \text{ and } WP_Z = \{v \in V : \operatorname{od}(v) \ge wp_Z\}$$

 $\Delta_U = \mathsf{max}_{v \in V} \, \mathsf{id}(v) \; \mathsf{and} \; \Delta_Z = \mathsf{max}_{v \in V} \, \mathsf{od}(v)$

The set V is partitioned into WP_U , WP_Z and $V \setminus (WP_U \cup WP_Z)$

$$M(\mathbf{UZ}) \leq wp_U \cdot wp_Z \cdot (\Delta_U + \Delta_Z + |V| - (wp_U + wp_Z))$$

$$\Delta_U \geq wp_U$$
 and $\Delta_Z \geq wp_Z \Rightarrow M(\mathbf{UZ}) \leq wp_U \cdot wp_Z \cdot O(|V|)$

Theorem. If $|U|, |V|, |Z| \sim O(n)$, $wp_U \cdot wp_Z \sim O(1)$ and $WP_U \cap WP_Z = \emptyset$ then $M(\mathbf{UZ}) \sim O(n)$.

Derived networks

The product provides a new network linking set U to set Z. In special cases (*projections*), $\mathbf{U}\mathbf{U} = \mathbf{U}\mathbf{V} \cdot \mathbf{U}\mathbf{V}^T$ and $\mathbf{V}\mathbf{V} = \mathbf{U}\mathbf{V}^T \cdot \mathbf{U}\mathbf{V}$, it transforms a two-mode network to an ordinary (one-mode) network. This turns out to be very useful in the analysis of collections of networks.

Example:

U= set of authors, V= set of papers, $u\mathbf{UV}v\equiv u$ coauthored v Z= set of keywords, $v\mathbf{VZ}z\equiv v$ is described by z UZ[u,z]=# of papers authored by u described by z. UU[u,t]=# of papers coauthored by u and t.

Network

Multiplication of networks

Derived networks

Reference

To get the right answers to some questions we have often to normalize networks used in products [Batagelj(2020)]. The contributions of intermediate nodes v to the product depend on sizes and values in \mathbf{H}_v .

Networks obtained from basic networks from a collection using multiplications or normalizations are called *derived* networks.

Assume that we would like that each intermediate node $v \in V$ contributes the same to the product total, $T(\mathbf{H}_v')=1$, for normalized networks $\mathbf{UZ}'=n(\mathbf{UV})\cdot n(\mathbf{VZ})$. We have

$$T(\mathbf{H}'_{v}) = \operatorname{wid}_{n(\mathbf{UV})}(v) \cdot \operatorname{wod}_{n(\mathbf{VZ})}(v) = 1$$

This can be achieved if we set $wid_{n(UV)}(v) = 1$ and $wod_{n(VZ)}(v) = 1$. Assume that n(UV)[u, v] = UV[u, v]/S, S > 0. We get

$$\operatorname{wid}_{n(\mathbf{UV})}(v) = \sum_{u} n(\mathbf{UV})[u, v] = \sum_{u} UV[u, v]/S = \operatorname{wid}_{UV}(v)/S = 1$$

Stochastic normalization Fractional approach

Derived Networks

V. Batagelj

Network

Multiplication of networks

Derived networks

References

For wid $_{UV}(v) > 0$ and wod $_{VZ}(v) > 0$ we finally have

$$n(UV)[u,v] = \frac{UV[u,v]}{\operatorname{wid}_{UV}(v)}$$
 and $n(VZ)[v,z] = \frac{VZ[v,z]}{\operatorname{wod}UV(v)}$

Note: in general we can have nodes with in/out-degree 0.

$$V^+(f) = \{ v \in V : f(v) > 0 \}$$

$$T(\textit{n}(\textbf{U}\textbf{V})) = \sum_{\textit{v}} \sum_{\textit{u}} \textit{n}(\textbf{U}\textbf{V})[\textit{u},\textit{v}] = \sum_{\textit{v}: \textbf{id}(\textit{v}) > 0} 1 = \textit{V}^{+}(\textbf{id}_{\textit{UV}}(\textit{v}))$$

and

$$T(\mathbf{UZ}') = \sum_{v} T(\mathbf{H}'_v) = |V^+(\mathsf{wid}_{\mathit{UV}}(v) \cdot \mathsf{wod}_{\mathit{VZ}}(v))|$$

Each active node in V has value 1 which is distributed over links from U to Z.

Normalized projection

Derived Networks

V. Batagelj

Network

Multiplication of networks

Derived networks

Kererence

In a special case $VZ = UV^T = VU$, $VV = VU \cdot UV$ we have

$$\mathsf{wid}_{\mathit{UV}}(v) = \mathsf{wod}_{\mathit{UV}^T}(v) = \mathsf{wod}_{\mathit{VZ}}(v) = \mathsf{wod}_{\mathit{VU}}(v)$$

and

$$n(VU)[v, u] = \frac{VU[v, u]}{\text{wod}_{VU}(v)}$$
 and $n(\mathbf{UV}) = n(\mathbf{VU})^T$

$$\mathbf{V}\mathbf{V}' = n(\mathbf{V}\mathbf{U}) \cdot n(\mathbf{U}\mathbf{V}) = n(\mathbf{V}\mathbf{U}) \cdot n(\mathbf{V}\mathbf{U})^T$$

Example:

V= set of papers, U= set of authors, $u\mathbf{V}\mathbf{U}v\equiv v$ is an author of u $2\cdot\mathbf{V}\mathbf{V}'[v,x]=$ fractional contribution of collaboration of authors v and x to the bibliography

Newman's normalization [Newman(2004)].

Linking through a network

Derived Networks

V. Batagelj

Networks

Multiplication of networks

Derived networks

Reference

Assume that we have an additional ordinary network ${\bf S}$ on V. We say that

$$UZ_S = UV \cdot S \cdot VZ$$

links U to Z through S.

In the bibliographic example we can consider S = citation network. Then $UZ_S[u,z]$ = number of citations of the author u to works described by keyword z.

As a fractional version we consider

$$UZ'_S = n(UV) \cdot S \cdot n(VZ)$$

Let's look at its total (all nodes in V active)

$$T(\mathbf{UZ}_S') = \sum_{v,v} S[v,y] \cdot \sum_{u} n(\mathbf{UV})[u,v] \cdot \sum_{z} n(\mathbf{VZ})[y,z] = T(\mathbf{S})$$

Linking through a network

Derived Networks

V. Batagelj

Network

Multiplication of networks

Derived networks

Reference

In the network \mathbf{UZ}_{S}' the total value of the network \mathbf{S} is redistributed on links from U to Z.

Replacing **S** with n(S) we get

$$T(\mathbf{UZ}'_{n(S)}) = T(n(S)) = V^+(\operatorname{od}_S(v))$$

In the network $\mathbf{UZ}'_{n(S)}$ each active node $v \in V$ has value 1 which is redistributed on links from U to Z.

Alternative normalized projections

Derived Networks

V. Batagelj

Network

Multiplication of networks

Derived networks

Let $b(\mathbf{UV})$ be a *binarized* version of a network \mathbf{UV} . $b(\mathbf{UV})[u,v] = \delta((u,v) \in \mathcal{L}_{UV})$. For a network \mathbf{UV} we define the left fractional contribution $I(\mathbf{UV}) = n(\mathbf{UV})^T \cdot b(\mathbf{UV})$ and the right fractional contribution $r(\mathbf{UV}) = b(\mathbf{UV})^T \cdot n(\mathbf{UV})$. We have

$$r(\mathbf{UV})^T = (b(\mathbf{UV})^T \cdot n(\mathbf{UV}))^T = n(\mathbf{UV})^T \cdot b(\mathbf{UV}) = I(\mathbf{UV})$$

and

$$I(UV)[v,y] = \frac{1}{\mathsf{wod}(v)} \sum_{u \in U} VU[v,u] \cdot b(VU)[y,u] \le 1$$

In general $I(UV)[v,y] \neq r(UV)[v,y]$. A symmetric measure/projection $VV_X[u,t]$ can be constructed as some $mean_X$ of these two quantities

$$VV_X[v,y] = mean_X(I(UV)[v,y], r(UV)[v,y])$$

= mean_X(I(UV)[v,y], I(UV)[y,v])
